

General Description

The MAX20356 evaluation kit (EV kit) is a fully assembled and tested circuit for evaluating the MAX20356 power-management solution designed for ultra-low-power wearable applications.

A flexible set of power-optimized voltage regulators, including 3 x buck converters, a buck-boost converter, 4 x linear regulators, including an RTC LDO, and 3 x load switches, provide a high level of integration and the ability to create a fully optimized power architecture. Refer to the MAX20356 IC data sheet for detailed information regarding the operation and features of the devices.

The device is configurable through an I²C interface that allows for programming various functions and reading device status. The EV kit GUI application sends commands to the MAXPICO2PMB# adapter board to configure the device.

The EV kit comes standard with the MAX20356 EV kit version IC installed.

Features

- USB-Power Option
- Flexible Configuration
- On-Board Battery Simulation
- Sense Test Point for Output-Voltage Measurement
- Windows® 8/Windows 10-Compatible Graphical User Interface (GUI) Software
- Fully Assembled and Tested

EV KIT Contents

- MAX20356_EVKIT_A System
- MAXPICO2PMB# board
- Two USB A to USB micro-B cables

MAX20356 EV Kit Files

FILE	DESCRIPTION
MAX20356EVKitSetupVxxx.exe	PC GUI Program

[Ordering Information](#) appears at end of data sheet.

Quick Start

Required Equipment

- MAX20356 EV kit
- Windows PC with USB ports
- One USB A-to-USB Micro-B cable and PICO2PMB adapter board with the latest firmware
- One USB A-to-USB Micro-B cable or power supply (for battery simulation or battery voltage)
- One USB A-to-USB Micro-B cable or power supply (for charger)
- One voltmeter

Note: In the following sections, software-related items are identified by bolding. Text in **bold** refers to items directly from the EV kit software. Text which is **bold and underlined** refers to items from the Windows operating system.

Procedure

The EV kit is fully assembled and tested. Follow the steps to install the EV kit software, make required hardware connections, and start operation of the kit.

1. Visit www.maximintegrated/evkitsoftware under the *Tools and Simulations* tab to download the latest version of the MAX20356 EV kit software. MAX20356EVKitSetupVxxx.zip is located on the MAX20356 EV kit web page. Save the software to a temporary folder and unpack the zip file.
2. Install the EV kit software on the computer by running the **MAX20356EVKitSetupVxxx.exe** program inside the temporary folder. This copies the program files and creates an icon in the Windows **Start** menu. The software requires the .NET Framework 4.5 or later. If connected to the internet, Windows automatically updates the .NET Framework as needed.
3. The EV kit software launches automatically after installation, and it can be launched by clicking on its icon in the Windows **Start** menu.
4. Verify that all jumpers are in their default positions, as shown in [Table 1](#).
5. Make sure JP7 and JP20 are not installed until all connections have been verified.
6. Connect the type-A end of a cable to the PC and the micro-USB end of a cable to the MAXPICO2PMB# board, and connect the MAXPICO2PMB# to J3 located on the top left of the EV kit board.

7. Connect a USB A to micro-B cable from the computer to J7 on the upper left corner of the EV kit board to use VBUS2 to power the battery simulation circuits on the board.
8. Reinstall JP7 and JP20.
9. Use a voltmeter to check VSIM test point is approximately 5V; BATSIM test point is approximately 3.7V. To adjust the BATSIM voltage, connect DMM to BATSIM TP and turn the R58 BATSIM potentiometer.
10. On the computer, open the MAX20356 GUI. The status bar at the bottom shows **MAX20356 Not Found**, as shown in [Figure 1](#). The IC is in Seal mode.
11. Set DMM to measure voltage and connect the positive lead to TP6, SYS and ground lead to any GND TP.
12. Hold PFN1 button for ~4s to power on the device and measure VSYS ~ 3.7V
13. The MAX20356EVKIT should be powered on, and the status of the EV kit Tool now shows **Connected**, and the registers are read and displayed [Figure 2](#).
14. The EV kit is now ready for additional evaluation.
15. To evaluate the battery charger, shunt J4 and plug in the USB micro-B cable to J1 of the EV kit to use USB VBUS power, or externally supply the charging power on TP4 CHGIN.

MAX20356 EV Kit Photo

Figure 1. MAX20356 Not Found Status

Figure 2. Connected Status

Detailed Description of Software

Software Startup

Upon starting the program, the EV kit software automatically searches for the USB interface circuit and then for the IC device addresses. The EV kit enters the normal operating mode when the connection is established and addresses are found. If the USB connection is not detected, the status bar displays **Not Connected**. If the USB connection is detected, but the MAX20356 is not found, the status bar shows **MAX20356 Not Found**.

ToolStrip Menu Bar

The **ToolStrip** menu bar ([Figure 3](#)) is located at the top of the GUI window. This bar comprises **File**, **Device**, **Options**, and **Help** menus; each function is detailed in the following sections.

Figure 3. The ToolStrip Menu Items

File Menu

The **File** menu contains the option to exit out of the GUI program.

Device Menu

The **Device** menu provides the ability to connect or disconnect the EV kit to the GUI. The **Advanced → I2C Read/Write** menu allows the user to read from or write to a selected register with a specified slave address. The **Advanced → Use USB2PMB2#** option should be checked if using with the USB2PMB2# adapter board.

Options Menu

The **Options** menu provides several settings to access additional features offered by the GUI. The **Disable Polling** option allows registers to be read manually instead of receiving automatic frequent register updates from the IC. The **Lock/Unlock** option allows for the lock or unlock of the bucks, buck-boost, LDOs, LSWs, charger, watchdog, and rail sequence through I2C.

Help Menu

The **Help** menu contains the **About** option, which displays the GUI splash screen indicative of the GUI version being used.

Tab Controls

The MAX20356 EV kit software GUI provides a convenient way to test the features of the MAX20356. Each tab contains controls relevant to various blocks of the device. Changing these interactive controls triggers a write operation to the MAX20356 to update the register contents. The **Read All** button reads all the configuration registers that are visible on the current tab page. The **Interrupts and Status** section in each tab shows the state of the status registers and their corresponding interrupts. Checking or unchecking the **Mask** option controls which interrupts cause the $\overline{\text{INT}}$ output to be pulled low when asserted.

Click the **Read Interrupts** button to read and clear the interrupts visible in the current tab. Asserted interrupts are denoted by bold text in the **Interrupt Name**. All statuses are polled continuously. The polling feature can be disabled in the **Options** section of the menu bar by selecting **Disable Polling**.

General Tab

The **General** tab (Figure 4) provides information on device info, PFNs and MPCs status, and configuration. Charger input current and voltage limit setting, IVMON setting, power commands, and some general interrupts and status are also found under this tab.

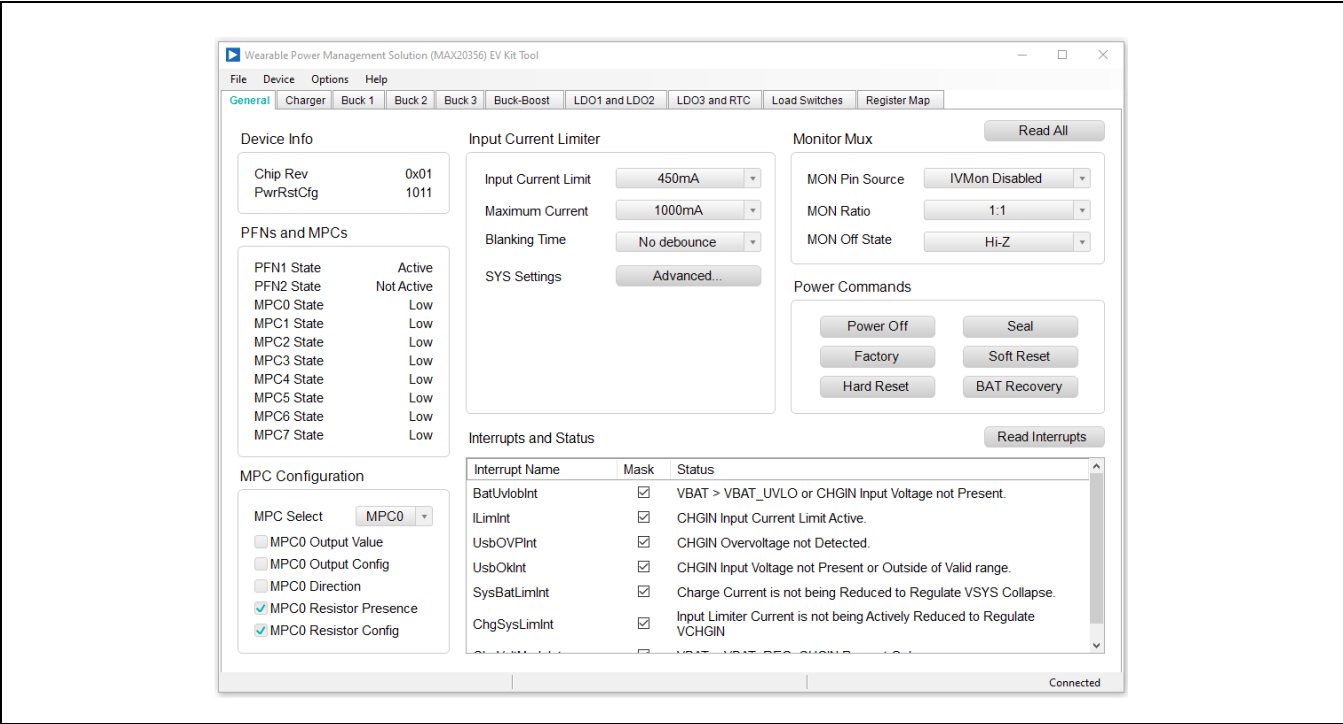

Figure 4. General Tab

Charger Tab

The **Charger** tab (Figure 5) provides options to set charger voltage, current, and timer in different charging states. The thermistor monitor configuration can be accessed by clicking the **Advanced** button.

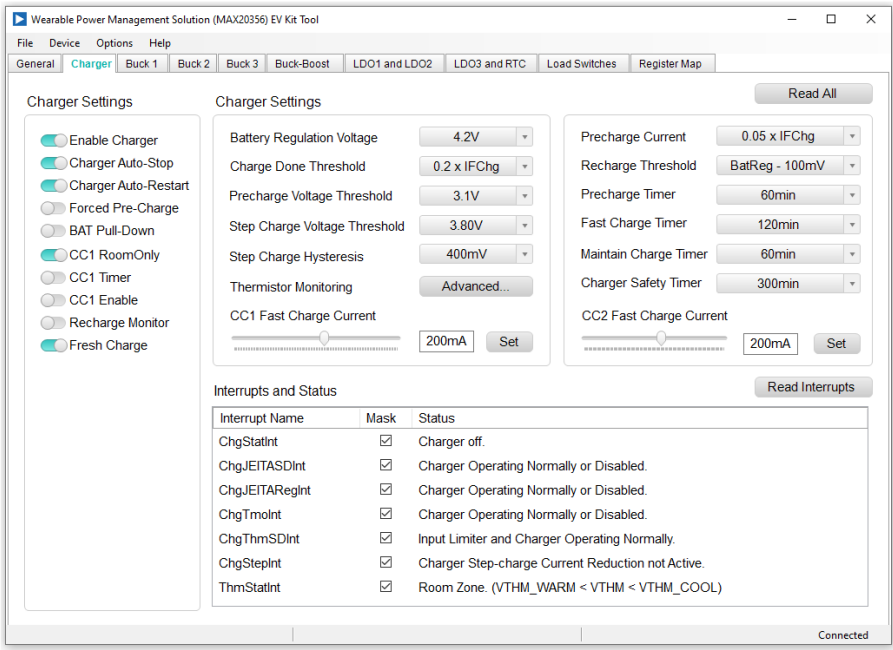

Figure 5. Charger Tab

Buck1/2/3, Buck-Boost Tab

The **Buck1**, **Buck2**, **Buck3**, and **Buck-Boost** tabs ([Figure 6](#), [Figure 7](#), [Figure 8](#) and [Figure 9](#)) provide options to enable buck/buck-boost, set output voltages, inductor current settings, DVS mode, voltage setting, and some additional settings.

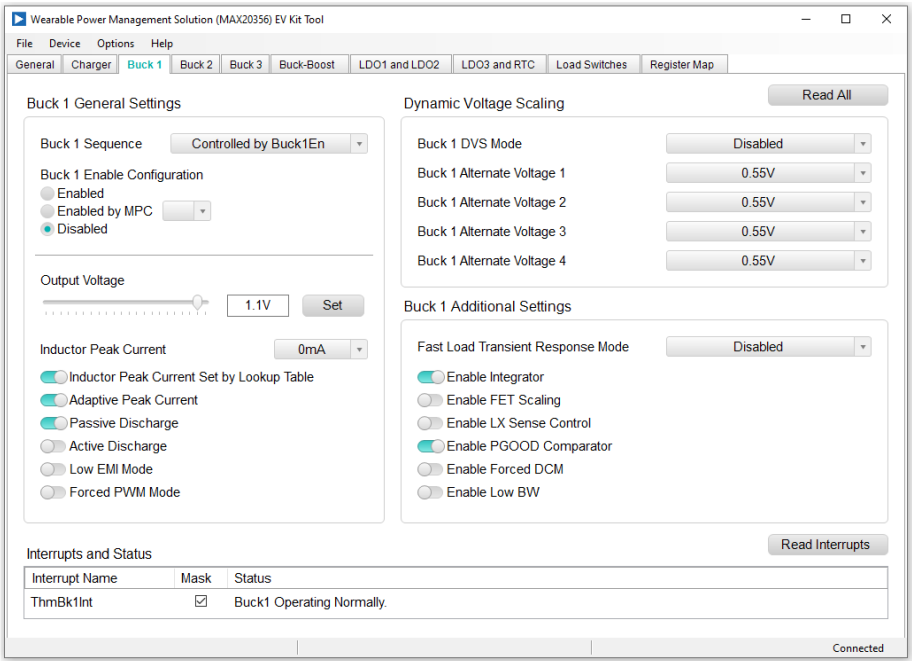

Figure 6. Buck1 Tab

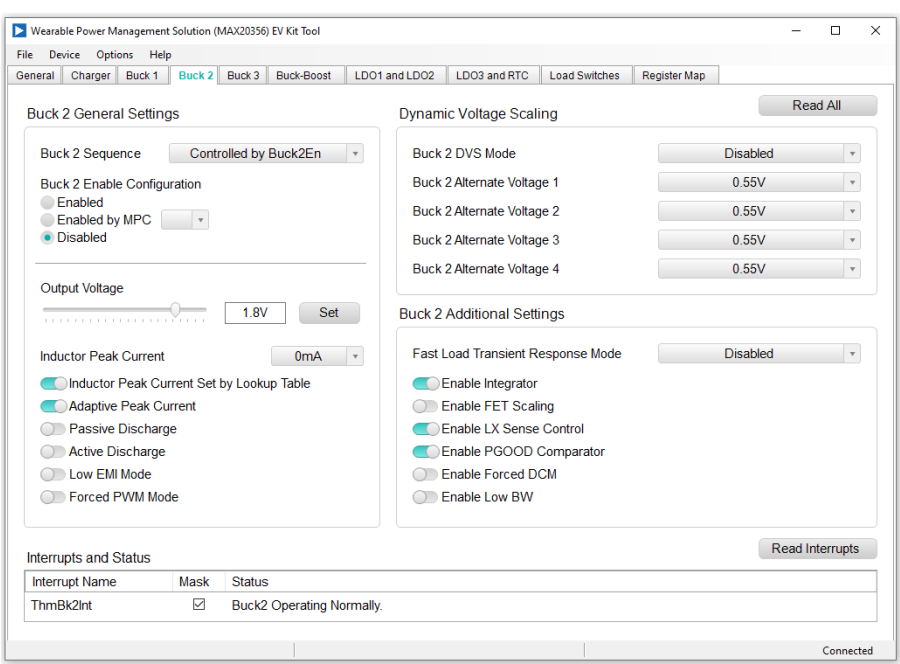

Figure 7. Buck2 Tab

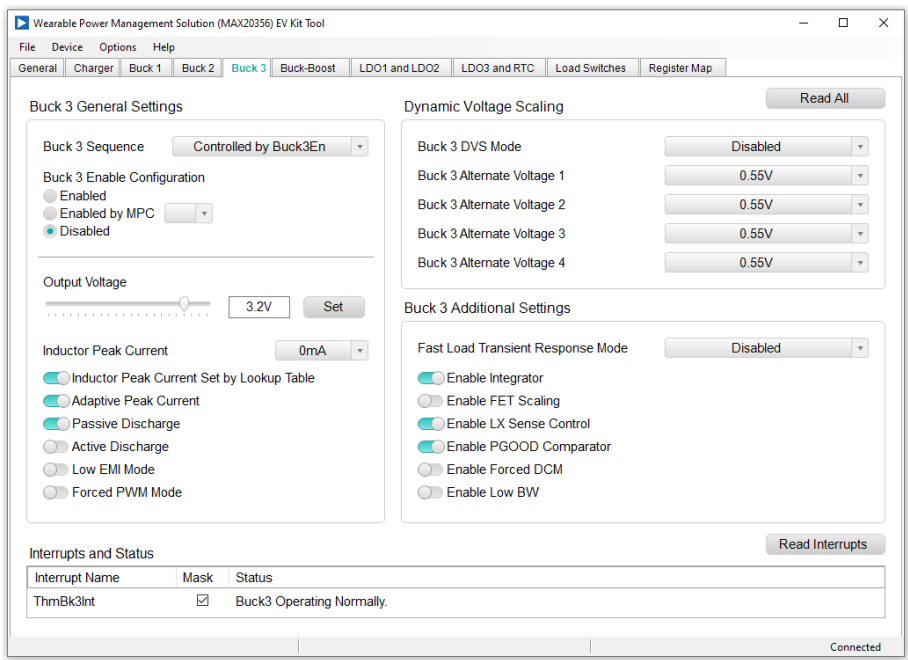

Figure 8. Buck3 Tab

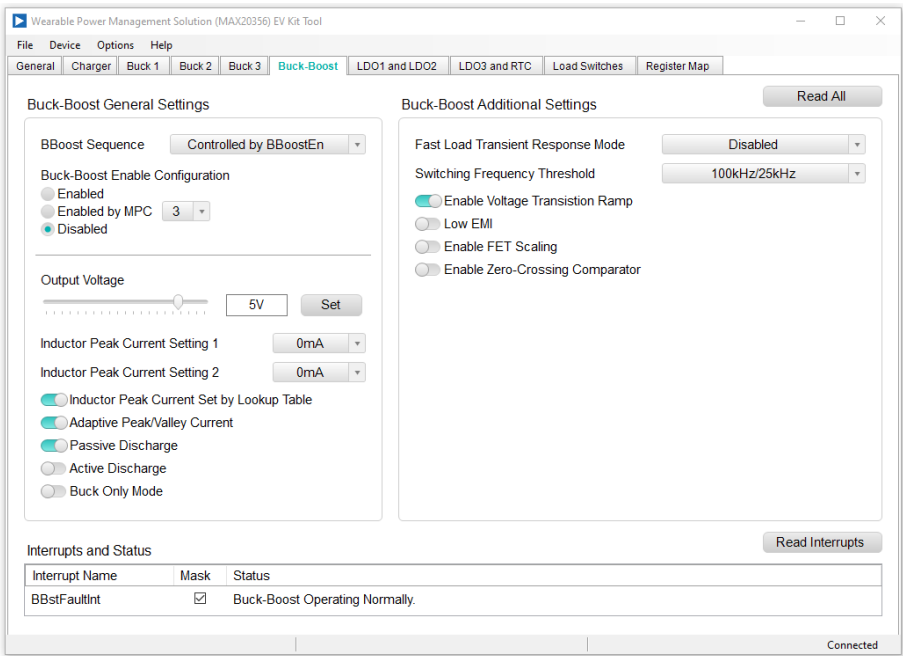

Figure 9. Buck-Boost Tab

LDO1/2/3 and RTC LDO Tab

The **LDO1** and **LDO2**, and **LDO3** and **RTC** (Figure 10 and Figure 11) provide options to enable LDOs, set LDO voltage, and change other LDO settings.

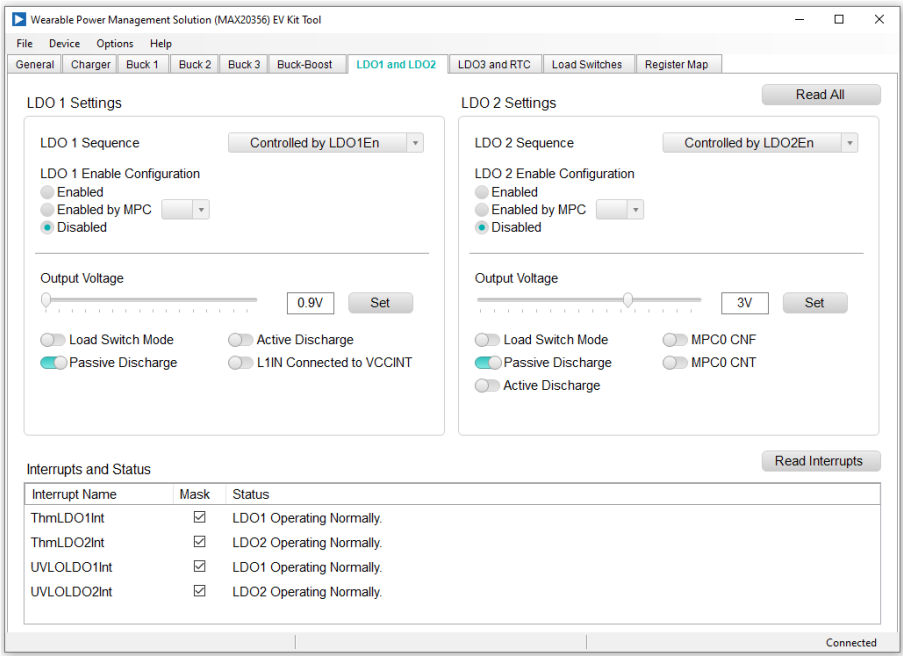

Figure 10. LDO1 and LDO2 Tab

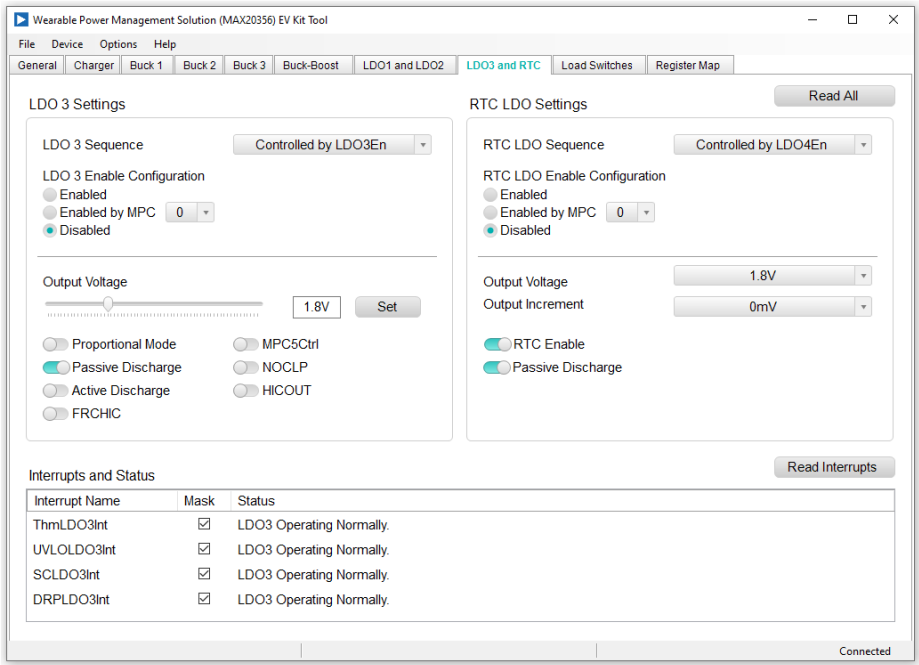

Figure 11. LDO3 and RTC Tab

Load Switches Tab

The **Load Switches** tab (Figure 12) includes Load Switch 1, Load Switch 2, and Load Switch 3 settings.

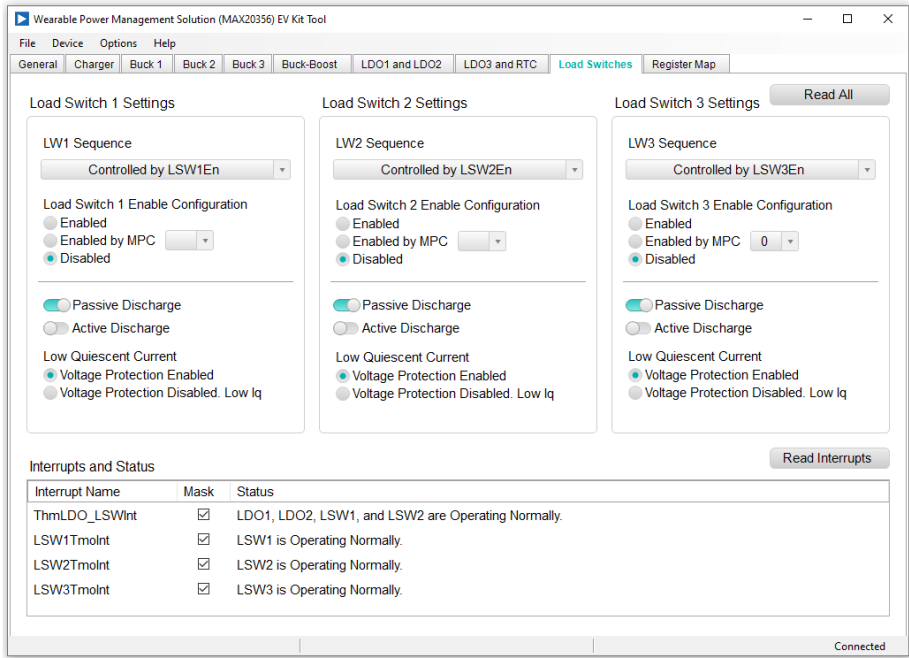

Figure 12. Load Switches Tab

Register Map Tab

The **Register Map** tab ([Figure 13](#)) provides all names and values of the MAX20356 registers. Click **Read All** in the top right corner to perform a burst read of all registers.

The left table shows the register to be read from and written to. The right table contains descriptions for each register field of the selected 8-bit register. All bits, along with their field names, are displayed at the bottom of the page.

To set a bit, click the bit label. **Bold** text represents logic 1, and regular text represents logic 0. To configure the changes to the device, click the **Write** button at the bottom right.

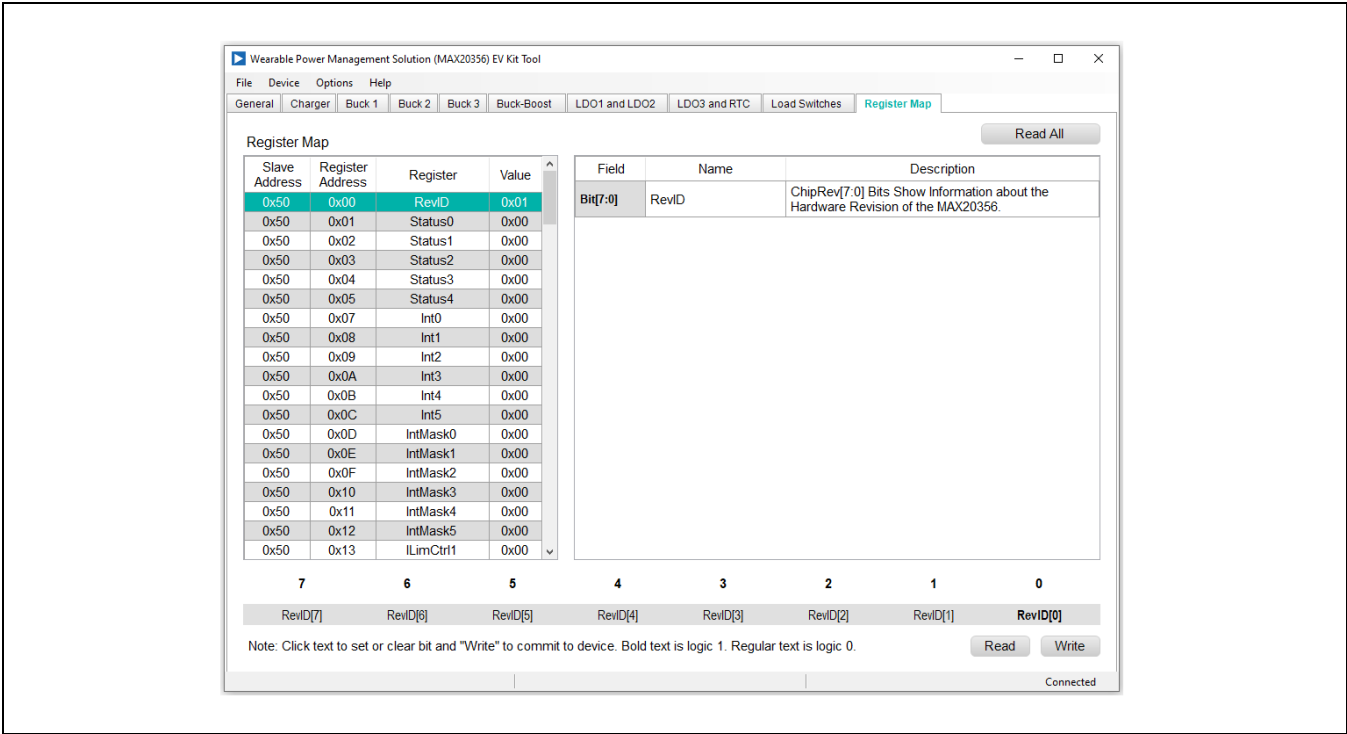

Figure 13. Register Map Tab

Detailed Description of Hardware

The MAX20356 EV kit evaluates the MAX20356 ultra-low-power wearable PMIC, which communicates over the I²C interface. The EV kit demonstrates the IC features such as bucks, buck-boost, linear regulators, load switches, and a battery charger. The EV kit uses the IC in a 63-bump wafer-level package on a proven, six-layer PCB design. The EV kit can use USB VBUS 5V DC for battery and charger input power source. Alternatively, the EV kit can be powered from an external power supply. [Figure 14](#) shows the EV kit block annotated picture.

Hardware Setup

To use the EV kit with the EV kit software, connect the MAXPICO2PMB# to the PMOD connector in the top left corner of the board. The MAXPICO2PMB# also provides 3.3V to the logic voltage VIO of the EV kit when shunting 1-2 in a JP20. The user can use the J7 USB VBUS to power the battery simulation circuits on the EV kit to supply the BAT of the IC. Turning the R58 potentiometer can change the BATSIM voltage. Connect BATSIM to the BAT of the IC with a shunt on JP9. Alternatively, instead of using battery simulation circuits on the board, the user can connect a Li-ion battery to the J2 connector. The user can use the J1 USB VBUS as a CHGIN source and place a shunt on J4.

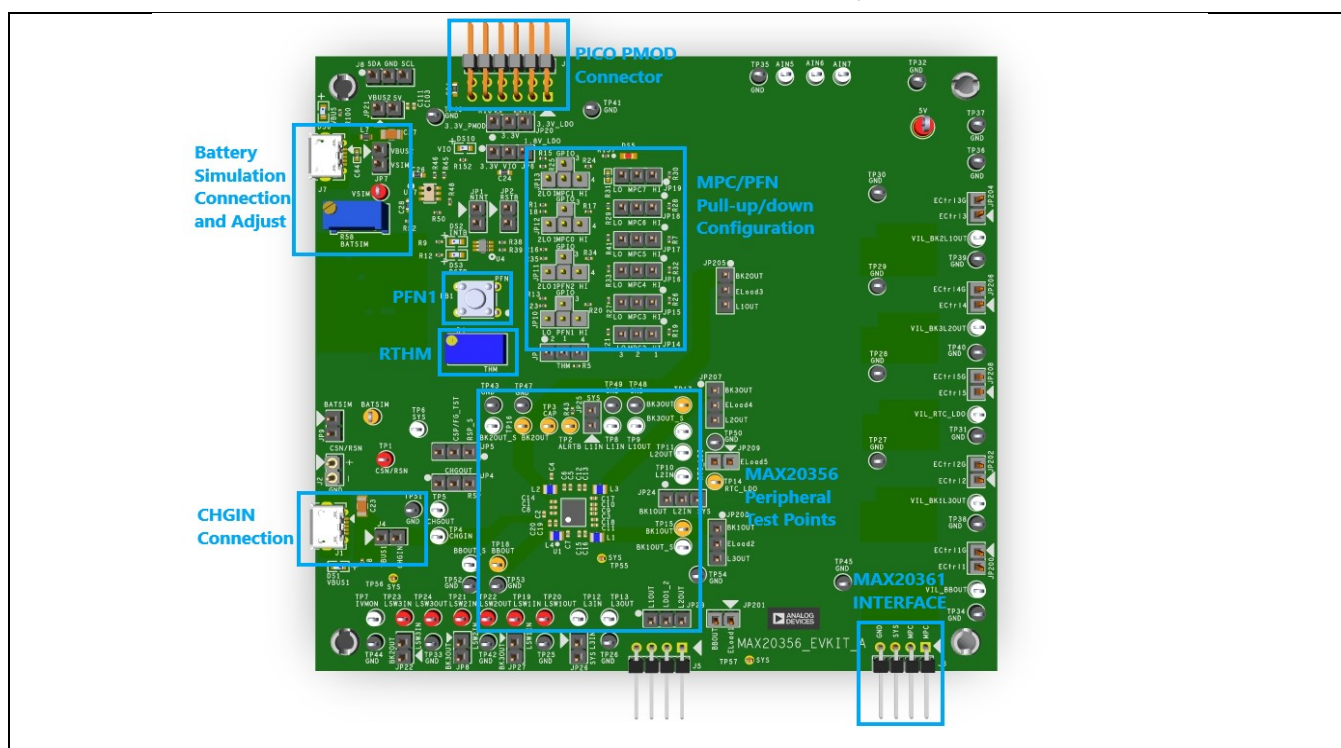

Figure 14. MAX20356 EV Kit Block Annotated Picture

PFNs and MPCs States

The PFNs and MPCs can be pulled up or pulled low to VIO through a 100kΩ resistor or connected to the ground through a 100kΩ resistor.

Regulators and Peripherals

All regulator outputs are made available on test points. The inputs to the LDOs and Load Switches can be supplied through setting the corresponding jumper for L_IN (JP25, JP24, and JP26) and LSW_IN (JP27, JP8, and JP22) or externally supplied through test points. The LDO1 input can be supplied from the V_{CCINT} of the IC if set through the I²C (bit LDO1IntSup). The bucks and buck-boost outputs have sense test points, which provide easy voltage measurement.

Thermistor setup

There are two configurations to set the desired thermistor voltage level. The thermistor pin has a 10k Ω internal pullup.

To position the thermistor in the room zone, set the DMM to measure Ω and connect the positive lead to pin1 of JP3. Turn the THM POT until the DMM reads $\sim 10\text{k}\Omega$.

Remove the DMM and install a shunt in position 1-2 of JP3. The register map should report that the thermistor is in the room temperature zone.

There is also a 10k Ω fixed resistor by positioning the JP3 shunt to 2-3. This setting will put the thermistor in the room temperature zone.

$\overline{\text{INT}}$ and $\overline{\text{RST}}$ LED Indicators

Shunts can be installed on JP1 and JP2 to show the status of $\overline{\text{INT}}$ and $\overline{\text{RST}}$ as LED indicators, DS2 and DS3. When the corresponding LED illuminates, it verifies the active-low output is pulled low.

Jumper Setting

[Table 1](#) shows the detailed jumper setting, and [Table 2](#) shows the connector description.

Table 1. Jumper Table

JUMPER	SHUNT POSITION	MAX20356 DESCRIPTION
JP1	1-2*	$\overline{\text{INT}}$ connect to pull up VIO and DS2
JP2	1-2*	$\overline{\text{RST}}$ connect to pull up VIO and DS3
JP3	1-2*	THM connect to potentiometer
	2-3	THM connect to 10k Ω
JP4	1-2*	Connects CHGOUT to CSN/RSN
	2-3	Connects CHGOUT to RSP
JP5	1-2	Connects CSP/FT_TST to RSP_S
	2-3*	Connects CSP/FT_TST to CSN/RSN
JP6	1-2*	Connects VIO to PMOD 3.3V
	1-3	Connects VIO to 1.8V_LDO
JP7	1-2*	Connects VBUS2 to VSIM
JP8	1-2	Connects BK3OUT to LSW2IN
JP9	1-2*	Connects BATSIM to CSN/RSN
JP10	1-2	PFN1 pull down to ground
	1-3	PFN1 connect to GPIO1
	1-4	PFN1 pull up to VIO
JP11	1-2	PFN2 pull down to ground
	1-3	PFN2 connect to GPIO1
	1-4	PFN2 pull up to VIO
JP12	1-2	MPC0 pull down to ground
	1-3	MPC0 connect to GPIO1
	1-4	MPC0 pull up to VIO
JP13	1-2	MPC1 pull down to ground
	1-3	MPC1 connect to GPIO1

	1-4	MPC1 pull up to VIO
JP14	1-2	MPC2 pull up to VIO
	2-3	MPC2 pull down to ground
JP15	1-2	MPC3 pull up to VIO
	2-3	MPC3 pull down to ground
JP16	1-2	MPC4 pull up to VIO
	2-3	MPC4 pull down to ground
JP17	1-2	MPC5 pull up to VIO
	2-3	MPC5 pull down to ground
JP18	1-2	MPC6 pull up to VIO
	2-3	MPC6 pull down to ground
JP19	1-2	MPC7 pull up to VIO
	2-3	MPC7 pull down to ground
JP20	1-2*	Selects 3.3V from 3.3V_PMOD
	2-3	Selects 3.3V from 3.3V_LDO
JP21	1-2	USB VBUS2 connects to 5V TP
JP22	1-2	Connects BK2OUT to LSW3IN
JP23	1-2	Connects LDO1_2 to L1OUT
	2-3	Connects LDO1_2 to L2OUT
JP24	1-2	Connects L2IN to BK1OUT
	2-3	Connects L2IN to SYS
JP25	1-2	Connects L1IN to SYS
JP26	1-2	Connects L3IN to SYS
JP27	1-2	Connects LSW1IN to BK3OUT
JP200	1-2	Reserved for future (RFU)
JP201	1-2	RFU
JP202	1-2	RFU
JP203	1-2	RFU
	2-3	RFU
JP204	1-2	RFU
JP205	1-2	RFU
	2-3	RFU
JP206	1-2	RFU
JP207	1-2	RFU
	2-3	RFU
JP208	1-2	RFU
JP209	1-2	RFU

*Default position.

Table 2. Connector Description

CONNECTOR	DESCRIPTION	
J1	Connect to USB cable for CHGIN voltage	
J2	J2 Connect to battery	
J3	Connect to MAXPICO2PMB#	
J4	Connect to the VBUS1 to CHGIN. Install to use CHGIN	
J5	1	Connects to BBOU
	2	Connects to LDO1_2 selector
	3	Connects to L3OUT
J6	1	Connects to MPC7
	2	Connects to MPC6
	3	Connects to SYS
J7	Connect to the USB cable for battery simulation and 5V connection	
J8	1	Connects to SDA
	2	Connects to GND
	3	Connects to SCL

MAXPICO2PMB Firmware Update

This section covers the procedure to update the PICO2PMB Adapter Board with the latest firmware by programming a firmware image file (.bin) onto the on-board MAX32625PICO microcontroller.

Put the board in maintenance mode by holding the button while the board is connected to the computer. It may be easier to hold the button while inserting the USB cable at the computer end rather than the micro-USB connector end (see [Figure 15](#)).

Figure 15. Enter Maintenance Mode on the MAX32625PICO.

If the board enters bootloader mode successfully, the LED on the board turns red, and the board appears to the computer as a USB drive named **MAINTENANCE**.

Drag and drop the firmware image file (.bin) into the **MAINTENANCE** drive, and the board installs the new firmware.

PROJECT TITLE MAX20356 EVKIT_A		DRAWING TITLE	
DATE 05/01/2022	DESIGNED BY HASONAREFAMJAMBER MAX20356	CHECKED BY B	DATE 05/01/2022
DATE 05/01/2022	DESIGNED BY HASONAREFAMJAMBER MAX20356	CHECKED BY B	DATE 05/01/2022

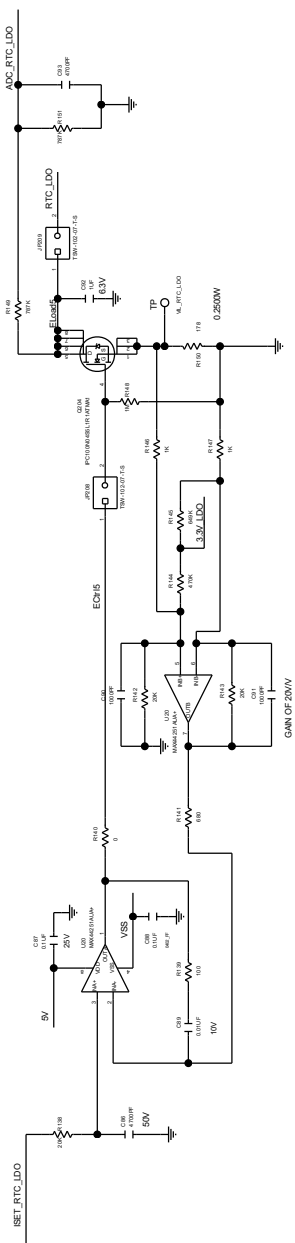

The image displays two circuit diagrams for the MAX9286 EVKIT A and B. The top diagram is for EVKIT A, and the bottom diagram is for EVKIT B. Both diagrams show a multi-stage signal path from SET BKOUT L2OUT through various op-amp buffers and comparators to AC BKOUT L2OUT. The diagrams include component values, pin numbers, and a table of component values.

Table 1: Component Values for EVKIT A
